

01. CREATE DATABASE

Most of this work will be done in Postgresql Shell

```
\l to list all files and dir
```

```
\d to list all database and
```

```
\d name will show the table
```

```
CREATE DATABASE name;
```

```
# To connect
```

```
\c name
```

```
$ This will show that you are connected to the database
```

```
# To get some info about this connection type
```

```
\conninfo
```

```
# This command is "ONLY" to be done if you are done with the database
```

```
DROP DATABASE name;
```

For me I like the pgAdmin GUI. Both are as good, so you work with the one you like best.
